ABOUT

As a project architect, Pat has taken projects from design inception through the entire process of construction and occupancy. This includes schools, hotels, historic renovations, medical facilities and commercial offices. Working with a client at the basic design phase includes space planning and facility usage specifically geared to the individual client's needs and desires and budget. As a project progresses, code review and more specific space planning is required. As a project is reviewed and constructed, coordination and communication between the Architect, Owner and Contractor is ongoing and critical.

Design and development of projects includes all aspects of planning and design, construction drawings (both Autocad and REVIT), specifications, coordination with local and state jurisdictions for code compliance and review, construction administration including site visits, documentation of changes and coordination with the Owner and Contractor, and final closeout of projects.

Having been in the field of architecture for over 30 years, Pat's work has included all aspects of design, code review, construction drawings and contract administration, and also includes time spent in the field for surveying and documentation.
